DP4® and DP4-B

**METAL-POLYMER SELF-LUBRICATING
LEAD FREE BEARING SOLUTIONS**

Pushing Boundaries to co-create
A higher Quality of Life

GGB helps create a world of motion with minimal frictional loss through plain bearing and surface engineering technologies. With R&D, testing and production facilities in the United States, Germany, France, Brazil, Slovakia and China, GGB partners with customers worldwide on customized tribological design solutions that are efficient and environmentally sustainable. GGB's engineers bring their expertise and passion for tribology to a wide range of industries, including automotive, aerospace and industrial manufacturing. To learn more about tribology for surface engineering from GGB, visit www.ggbearings.com.

Our products are used in tens of thousands of critical applications every day on our planet. It is always our goal to provide superior, high-quality solutions for our customers' needs, no matter where those demands take our products. From space vehicles to golf carts and virtually everything in between; we offer the industry's most extensive range of high performance, maintenance-free bearing solutions for a multitude of applications:

— Aerospace	— E-Mobility	— Medical	— Primary Metals
— Agricultural	— Energy	— Mining	— Railway
— Automotive	— Fluid Power	— Oil & Gas	— Recreation
— Construction	— Industrial		

The GGB Advantage

LOWER SYSTEM COST

GGB bearings reduce shaft costs by eliminating the need for hardening and machining grease paths. Their compact, one-piece construction provides space and weight savings and simplifies assembly.

LOW-FRICTION, HIGH WEAR RESISTANCE

Low coefficients of friction eliminate the need for lubrication, while providing smooth operation, reducing wear and extending service life. Low-friction also eliminates the effects of stick-slip or "stiction" during start up.

MAINTENANCE-FREE

GGB bearings are self-lubricating, making them ideal for applications requiring long bearing life without continuous maintenance, as well as operating conditions with inadequate or no lubrication.

ENVIRONMENTAL

Greaseless, lead-free GGB bearings comply with increasingly stringent environmental regulations such as the EU RoHS directive restricting the use of hazardous substances in certain types of electrical and electronic equipment.

CUSTOMER SUPPORT

GGB's flexible production platform and extensive supply network assure quick turnaround and timely deliveries. In addition, we offer local applications engineering and technical support.

The Highest Standards in Quality

SAFETY

Our deep-rooted culture of safety places a relentless focus on creating a secure, healthy work environment for all. As one of our core values, safety is essential for us to achieve our goal of having the safest employees in the industry.

EXCELLENCE

Our world-class manufacturing plants in the United States, Brazil, China, Germany, France, and Slovakia are certified in quality and excellence according to ISO 9001, IATF 16949, ISO 14001, ISO 45001, and AS9100D/EN9100. This allows us to access the industry's best practices while aligning our management system with global standards.

For a complete listing of our certifications, please visit our website:
https://www.ggbearings.com/en/certificates

RESPECT

Our teams work together with mutual respect regardless of background, nationality, or function, embracing the diversity of people and learning from one another - after all, with respect comes both individual and group growth.

GGB - Who We Are

AT GGB, WE AREN'T AFRAID TO TAKE RISKS FOR OUR CUSTOMERS.

We are passionate about the work we do and believe that same passion contributes to the level of innovation that can enhance human potential. We take pride in working closely with customers in the early stage of a design to think broadly and boldly, and to expand beyond traditional surface engineered solutions. We offer reliable partnerships based on trust, compassion, determination, collaboration and respect.

As the tribological leader, GGB helps create a world of motion with minimal frictional loss through plain bearing and surface engineering technologies. Thanks to our global footprint and wealth of specific applications expertise, our capabilities are virtually limitless. We work to push the boundaries of possibility, inspiring customers across all markets to partner - and innovate - alongside us.

Table of Contents

Table of Contents

1 Introduction

The purpose of this handbook is to provide comprehensive technical information on the characteristics of DP4® and DP4-B bearings.

The information given permits designers to establish the correct size of bearing required and the expected life and performance.

In addition, your local sales representative is available to assist you with your design. Complete information on the range of DP4® standard stock products is given together with details of other DP4® products.

GGB is continually refining and extending its experimental and theoretical knowledge and, therefore, when using this brochure it is always worth-while to contact GGB should additional information be required.

As it is impossible to cover all conditions of operation which arise in practice, customers are advised to carry out prototype testing wherever possible.

1.1 CHARACTERISTICS AND ADVANTAGES

The DP4® and DP4-B materials offer the following characteristics:

— Good frictional properties with negligible stick-slip

— High static and dynamic load capacity

— Suitable for rotating, oscillating, reciprocating and sliding movements

— Compact size and low weight

— Prefinished that requires no machining after assembly

— Possibility to burnish for reduced operating clearance

— No water absorption and therefore dimensionally stable

— Suitable for a wide operating temperature range from - 200 to +280 °C

— DP4-B with bronze backing for increased corrosion resistance

— Lead free in compliance with European RoHS 2002/95/EC, 2002/96/EC and EVL 2000/53/EC directives (see page 55)

In particular, depending on the dry running conditions, DP4® and DP4-B materials present the following performance advantages:

Dry conditions

— Good friction and wear performance under light duty conditions

— Particularly suitable for intermittent oscillating and reciprocating movements

— Maintenance free as no external lubrication required

— Seizure resistant.

Lubricated conditions

— Good wear and friction performance over a wide range of load, speed and temperature conditions

— High wear resistance in boundary operating conditions

— High resistance of bearing surface under fluid cavitation and flow erosion conditions

— Suitable for operation in diverse fluids (oil, fuel, solvents, refrigerants, water).

1 Introduction

1.2 APPLICATIONS

Given the performance characteristics in both dry and lubricated operating conditions, DP4® and DP4-B bearing materials are extensively used in a wide range of automotive and industrial applications, such as:

Automotive
Braking systems, clutches, gearbox and transmissions, hinges - door bonnet and boot, convertible roof tops, pedal systems, pumps - axial, radial, gear and vane, seat mechanisms, steering systems, struts and shock absorbers, wiper systems.

Industrial
Aerospace, agricultural, construction equipment, food and beverage, marine, material handling, office equipment, packaging equipment, pneumatic and hydraulic cylinders, railroad and tramways, textile machinery, valves.

2 Structure and Composition

DP4® / DP4-B

DP4® is a composite bearing material. It consists of a steel DP4® / bronze DP4-B backing to which is bonded a porous sinter bronze interlayer which is overlaid and impregnated with Polytetrafluoroethylene (PTFE) containing a mixture of inorganic fillers and special polymer fibres. The steel DP4® / bronze DP4-B backing provides mechanical strength and the bronze sinter layer provides a strong mechanical bond for the filled bearing lining.

2.1 BASIC FORMS

Standard Components

These products are manufactured to International, National or GGB standards. The following components are standard stock products:

— Cylindrical Bushes　— Flanged Bushes　— Thrust Washers　— Flanged Washers　— Strip Material
Fig.3: Standard stock products

Non-standard Components

These products are manufactured to customer's requirements and include for example:

— Modified Standard Components　— Half Bearings　— Flat Components　— Deep Drawn Parts　— Pressings　— Stampings

Fig.4: Non-standard components

3 Properties

3.1 PHYSICAL AND MECHANICAL PROPERTIES

Kerosene	20	+	+
Diesel Fuel	20	+	+
Mineral Oil	70	+	+
HFA-ISO46 High Water Fluid	70	+	+
HFC-Water-Glycol	70	+	+
HFD-Phosphate Ester	70	+	+
Water	20	o	+
Sea Water	20	-	o

Table 2: Chemical Resistance of DP4 and DP4-B

+ Satisfactory: Corrosion damage is unlikely to occur

o Acceptable: Some corrosion damage may occur but this will not be sufficient to impair either the structural integrity or the tribological performance of the material

- Unsatisfactory: Corrosion damage will occur and is likely to affect either the structural integrity and/or the tribological performance of the material

Electrochemical Corrosion

DP4-B should not be used in conjunction with aluminium housings due to the risk of electrochemical corrosion in the presence of water or moisture.

3.3 FRICTIONAL PROPERTIES

DP4® bearings show negligible 'stick-slip' and provide smooth sliding between adjacent surfaces. The coefficient of friction of DP4® depends upon:

- The specific load p [MPa]
- The sliding speed U [m/s]
- The roughness of the mating running surface Ra [µm]
- The bearing temperature T [°C].

A typical relationship is shown in Fig. 5, which can be used as a guide to establish the actual friction under clean, dry conditions after running in. Exact values may vary by ±20 % depending on operating conditions. Before running in, the friction may be up to 50 % higher.

After progressively longer periods of dwell under load (e.g. hours or days) the static coefficient of friction on the first movement may be between 1.5 and 3 times greater, particularly before running in.

Effect of Temperature for Unlubricated Applications

The coefficient of friction of DP4® varies with temperature. Typical values are shown in Fig. 6 for temperatures up to 250 °C. Friction increases at bearing temperatures below 0 °C. Where frictional characteristics are critical to a design they should be established by prototype testing.

Example:
Specific load p = 1.4 MPa
Sliding speed U = 0.005 m/s
Friction coefficient f = 0.175

- 0.25 - 0.30
- 0.20 - 0.25
- 0.15 - 0.20
- 0.10 - 0.15
- 0.05 - 0.10
- 0.00 - 0.05

Fig. 5: Variation of friction coefficient f with specific load p and sliding speed U at temperature T = 25 °C

Example:
Specific load p = 4 MPa
Temperature T= 40 °C
Friction coefficient f = 0.14

- 0.25 - 0.30
- 0.20 - 0.25
- 0.15 - 0.20
- 0.10 - 0.15
- 0.05 - 0.10
- 0.00 - 0.05

Fig. 6: Variation of friction coefficient f with specific load p and temperature T at sliding speed U = 0.01 m/s

4 Bearing Performance

4.1 MCPHERSON STRUT APPLICATIONS

DP4® has been developed to provide improved wear, erosion resistance and reduced friction in McPherson strut piston rod guide bush applications under the most demanding of operating conditions.

In the following sections, the performance of DP4® is compared with that of the material used in the majority of this type of application.

Wear and friction properties

The wear and frictional performance of DP4® has been evaluated in the piston rod guide bush application of a McPherson strut shock absorber using the test rig shown in Fig. 7. The test conditions are designed to simulate the operational duty of the test strut in service and differ in detail according to the strut manufacturer. The test conditions used are given in Table 3 and Table 4.

McPherson strut test rig
Fig. 7: Principle of the strut test rig

STRUT WEAR - TEST CONDITIONS	
Waveform	Sine
Frequency	2.5 Hz
Side load	890 N
Test duration	100 hours
Stroke	100 mm
Mean diametral clearance	0.06 mm
Lubricant	TEX 0358
Foot valve temperature	70 °C

Table 3: McPherson strut wear test conditions

STRUT FRICTION - TEST CONDITIONS	
Waveform	Sine
Frequency	0.1 Hz
Side load	600 N
Stroke	70 mm
Mean diametral clearance	0.06 mm
Lubricant	TEX 0358
Foot valve temperature	ambient

Table 4: McPherson strut friction test conditions

The relative wear and frictional performance of DP4® tested under these conditions are shown in Figures 8 - 10. Actual results for the wear rate and friction are not quoted because these depend strongly on the actual test conditions and design of the strut under test. The relative performance plots shown thus provide the best indication as to the benefits offered by DP4® in this class of application.
Fig. 8: Relative wear resistance
Fig. 9: Relative static friction coefficient
Fig. 10: Relative dynamic friction coefficient

4 Bearing Performance

Cavitation Erosion Resistance

Under certain operating conditions, the PTFE lining of the McPherson strut piston rod guide bush can suffer erosion damage, due to cavitation and flow erosion effects from the oil film within the bearing. The test rig shown in Fig. 11 is designed to reproduce the cavitation erosion damage to the bearing lining of the test specimen.

The test conditions are given in Table 5.
Fig. 11: Principle of the cavitation erosion test rig

CAVITATION EROSION - TEST CONDITIONS	
Amplitude	0.015 mm
Frequency	20 kHz
Separation	1 mm
Test duration	30 minutes
Lubricant	TEX 0358
Temperature	ambient

Table 5: Cavitation erosion test conditions

The relative resistance to cavitation damage of DP4® as evaluated on this test rig is shown in Fig. 12.
Fig. 12: Relative resistance to cavitation erosion

Flow Erosion Resistance

The test rig shown in Fig. 13 is designed to reproduce flow erosion damage to the bearing lining of the test specimen.

The test conditions are given in Table 6.
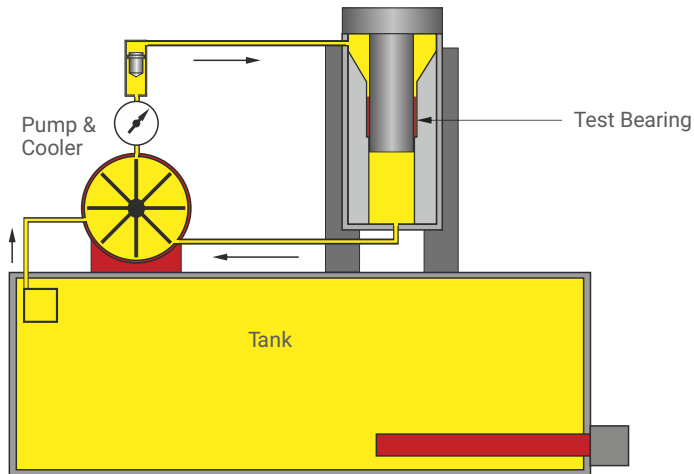

Fig. 13: Principle of the flow erosion test rig

FLOW EROSION - TEST CONDITIONS	
Bearing diameter	20 mm
Bearing length	15 mm
Diametral clearing	0.11 mm
Pressure	13.8 MPa
Flow rate	5 l/min
Test duration	20 hours
Shaft surface finish	0.15 µm ±0.05
Temperature	ambient

Table 6: Flow erosion test conditions

The relative resistance to flow erosion damage of DP4® as evaluated on this test rig is shown in Fig. 14.
Fig. 14: Relative resistance to flow erosion

4 Bearing Performance

4.2 HYDRAULIC APPLICATIONS

DP4 also shows excellent wear and frictional performance in a wide range of oil lubricated hydraulic applications. The wear resistance of DP4 under steady load oil immersed boundary lubrication conditions has been evaluated using the test rig shown in Fig. 15. The test conditions are given in Table 7.

GGB Jupiter Test Rig
Fig. 15: Principle of the GGB Jupiter test rig

LUBRICATED WEAR - TEST CONDITIONS	
Bearing diameter	20 mm
Bearing length	15 mm
Mean diametral clearing	0.10 mm
Speed	0.11 m/s
Lubricant	ISO VG 46 hydraulic oil

Table 7: Lubricated wear test conditions

The relative pU limits with boundary lubrication of DP4® and the material used in many high performance hydraulic pump applications as determined from these tests are shown in Fig. 16. The limiting pU depends upon the actual operating conditions and hence the relative performance only is given for guidance.
Fig. 16: Relative pU limits

4.3 DRY WEAR PERFORMANCE

Desgin Factors

The main parameters when determining the size or calculating the service life for a DP4® bearing are:

- Specific load limit p_{lim}
- pU Factor
- Mating surface roughness Ra

- Mating surface material
- Temperature T
- Other environmental factors e.g. housing design, dirt, lubricationtions.

The following calculation can be used to estimate the bearing service life of DP4® under dry running conditions.

Specific Load p

For the purpose of assessing bearing performance the specific load p is defined as the working load divided by the projected area of the bearing and is expressed in MPa.

Cylindrical Bush

(4.3.1)   [MPa]

$$p = \frac{F}{D_i \cdot B}$$

Thrust Washer

(4.3.2)   [MPa]

$$p = \frac{4F}{\pi \cdot (D_o^2 - D_i^2)}$$

Flanged Bush (Axial Loading)

(4.3.3)   [MPa]

$$p = \frac{F}{0,04 \cdot (D_{fl}^2 - D_i^2)}$$

Slideway

(4.3.4)   [MPa]

$$p = \frac{F}{L \cdot W}$$

Projected Area
$A = D_i \cdot B$

Fig. 17: Projected Area

Specific Load Limit p_{lim}

The maximum load which can be applied to a DP4® bearing can be expressed in terms of the Specific Load Limit, which depends on the type of the loading. It is highest under steady loads. Conditions of dynamic load or oscillating movement which produce fatigue stress in the bearing result in a reduction in the permissible Specific Load Limit.

In general the specific load on a DP4® bearing should not exceed the Specific Load Limits given in Table 8.

The values of Specific Load Limit specified in Table 8 assume good alignment between the bearing and mating surface (Fig. 35, page 33).
4 Bearing Performance

Maximum Specific Load p_{lim}

TYPE OF LOADING / p_{lim} [MPa]									
Steady load - rotating movement p_{lim} 140									
Steady load - oscillating movement									
p_{lim}	140	140	115	95	85	80	60	44	30	20
Number of movement cycles Q	1000	2000	4000	6000	8000	10^4	10^5	10^6	10^7	10^8
Dynamic load - rotating or oscillating movement									
p_{lim}	60	60	50	46	42	40	30	22	15	10
Number of load cycles Q	1000	2000	4000	6000	8000	10^4	10^5	10^6	10^7	10^8

Table 8: Maximum specific load p_{lim}

Permanent deformation of the DP4® bearing lining may occur for specific loads above 140 MPa unless with slow intermittent movements. Under these conditions, it is recommended to contact GGB for further information.

The permissible maximum load on a thrust washer is higher than that on the flange of a flanged bush, and under conditions of high axial loads a thrust washer should be specified.

Sliding Speed U

Speeds in excess of 2.5 m/s sometimes lead to overheating, and a running in procedure may be beneficial. This could consist of a series of short runs progressively increasing in duration from an initial run of a few seconds.

Continuous Rotation

Cylindrical Bush

(4.3.5)   [m/s]

$$U = \frac{D_i \cdot \pi \cdot N}{60 \cdot 10^3}$$

Thrust Washer

(4.3.6)   [m/s]

$$U = \frac{\frac{D_o + D_i}{2} \cdot \pi \cdot N}{60 \cdot 10^3}$$

Oscillating Movement

Cylindrical Bush

(4.3.7)   [m/s]

$$U = \frac{D_i \cdot \pi}{60 \cdot 10^3} \cdot \frac{4\varphi \cdot N_{OSZ}}{360}$$

Thrust Washer

(4.3.8)   [m/s]

$$U = \frac{\frac{D_o + D_i}{2} \cdot \pi}{60 \cdot 10^3} \cdot \frac{4\varphi \cdot N_{OSZ}}{360}$$
Figure 18: Oscillating cycle φ

pU Factor

The useful operating life of a DP4® bearing is governed by the pU factor, the product of the specific load p [MPa] and the sliding speed U [m/s].

For thrust washers and flanged bush thrust faces the rubbing velocity at the mean diameter is used.

pU factors up to 1.0 MPa x m/s can be accommodated for short periods, whilst for continuous rating, pU factors up to 0.5 MPa x m/s can be used, depending upon the operating life required.

	DU	UNIT
p	140	MPa
U	2.5	m/s
pU continuous	0.5	MPa · m/s
pU intermittent	1.0	MPa · m/s

Table 9: Typical data p, U and pU

Calculation of pU Factor

$$(4.3.9) \qquad\qquad [MPa \cdot m/s]$$
$$pU = p \cdot U$$

Applicaton Factors

The following factors influence the bearing performance of DP4® and must be considered in calculating the required dimension or estimating the bearing life for a particular application.

Temperature

The useful life of a DP4® bearing depends upon the operating temperature.

Under dry running conditions frictional heat is generated at the rubbing surface of the bearing dependent on the pU condition. For a given pU factor the operating temperature of the bearing depends upon the temperature of the surrounding environment, the heat dissipation properties of the housing and the mating surface. Intermittent operation affects the heat dissipation from the assembly and hence the operating temperature of the bearing.

The effect of temperature on the operating life of DP4® bearings is indicated by the factor a_T shown in Table 10.

MODE OF OPERATION	NATURE OF HOUSING	TEMPERATURE OF BEARING ENVIRONMENT T_{amb} [°C] AND TEMPERATURE APPLICATION FACTOR a_T					
		[°C] 25	60	100	150	200	280
Dry continuous operation	Average heat dissipating qualities	1.0	0.8	0.6	0.4	0.2	0.1
Dry continuous operation	Light pressings or isolated housing with poor heat dissipating qualities	0.5	0.4	0.3	0.2	0.1	-
Dry continuous operation	Non-metallic housings with bad heat dissipating qualities	0.3	0.3	0.2	0.1	-	-
Dry intermittent operation (duration less than 2 min, followed by a longer dwell period)	Average heat dissipating qualities	2.0	1.6	1.2	0.8	0.4	0.2

Table 10: Temperature application factor a_T

4 Bearing Performance

Mating Surface

The effect of the mating surface material type on the operating life of DP4® bearings is indicated by the mating surface factor a_M and the life correction constant a_L shown in Table 11.

MATERIAL	a_M	a_L
Steel and Cast Iron		
Carbon Steel	1	400
Carbon Manganese Steel	1	400
Alloy Steel	1	400
Case Hardened Steel	1	400
Nitrided Steel	1	400
Salt bath nitrocarburised	1	400
Stainless Steel (7-10 % Ni, 17-20 % Cr)	2	400
Cast Iron (0.3 ± 0.1 µm R_a)	1	400

Table 11: Mating surface factor a_M and life correction constant a_L

Note:

The factor values given assume a mating surface finish of R_a = 0.4 ± 0.1 µm.

— A ground surface is preferred to fine turned

— Surfaces should be cleaned of abrasive particles after polishing

— Cast iron surfaces should be ground to R_a = 0.3 ± 0.1 µm

— The grinding cut should be in the same direction as the bearing motion relative to the shaft

Bearing Size

The running clearance of a DP4® bearing increases with bearing diameter resulting in a proportionally smaller contact area between the shaft and bearing. This reduction in contact area has the effect of increasing the actual unit load and hence pU factor. The bearing size factor (Fig. 20) is used in the design calculations to allow for this effect.
Figure 19: Contact area between bearing and shaft
Fig. 20: Bearing size factor a_B

Bore Burnishing

Burnishing or machining the bore of a DP4® bearing results in a reduction in the wear performance. The application factor a_C given in table 12 is used in the design calculations to allow for this effect. Machining DP4® is not recommended.

DEGREE OF SIZING	APPLICATION FACTOR a_C	
BURNISHING	0.025 mm	0.8
Excess of burnishing tool diameter over	0.038 mm	0.6
mean bore size	0.050 mm	0.3

Table 12: Bore burnishing or machining application factor a_C

Type of Load

The type of load is considered in formula (4.4.9) page 23 and (4.4.10) page 23.
Fig. 21: Steady load, bush stationary, shaft rotating
Fig. 22: Rotating load, shaft stationary, bush rotating

4 Bearing Performance

4.4 CALCULATION OF BEARING SERVICE LIFE

Where the size of a bearing is governed largely by the space available the following calculation can be used to determine whether its useful life will satisfy the requirements. If the calculated life is inadequate, a larger bearing should be considered.

Specific Load p

Bushes

(4.4.1)   [MPa]

$$p = \frac{F}{D_i \cdot B}$$

Flanged bushes

(4.4.2)   [MPa]

$$p = \frac{F}{0.04 \cdot (D_{fl}^2 - D_i^2)}$$

Thrust washers

(4.4.3)   [MPa]

$$p = \frac{4F}{p \cdot (D_o^2 - D_i^2)}$$

High load factor a_E

(4.4.4)   [-]

$$a_E = \frac{p_{lim} - p}{p_{lim}}$$

p_{lim} see Table 8, Page 18

If a_E is negative then the bearing is overloaded. Increase the bearing diameter and/or length.

Modified pU Factor

Bushes

(4.4.5)   [MPa · m/s]

$$pU = \frac{5.25 \cdot 10^{-5} F \cdot N}{a_E \cdot B \cdot a_T \cdot a_M \cdot a_B}$$

Flanged bushes

(4.4.6)   [MPa · m/s]

$$pU = \frac{6.5 \cdot 10^{-4} F \cdot N}{a_E \cdot (D_{fl} - D_i) \cdot a_T \cdot a_M \cdot a_B}$$

Thrust washers

(4.4.7)   [MPa · m/s]

$$pU = \frac{3.34 \cdot 10^{-5} F \cdot N}{a_E \cdot (D_o - D_i) \cdot a_T \cdot a_M \cdot a_B}$$

For oscillating movement, calculate the average rotational speed.

(4.4.8)   [1/min]

$$N = \frac{4\varphi \cdot N_{osz}}{360}$$
Figure 23: Oscillating cycle φ

Estimation of Bearing Life L_H

Bushes (Steady load)

(4.4.9)   [h]

$$L_H = \frac{265}{pU} - a_L$$

Bushes (Rotating load)

(4.4.10)   [h]

$$L_H = \frac{530}{pU} - a_L$$

Flanged Bushes (Axial load)

(4.4.11)   [h]

$$L_H = \frac{175}{pU} - a_L$$

Thrust Washers

(4.4.12)   [h]

$$L_H = \frac{175}{pU} - a_L$$

Bore Burnishing

If the DP4® bush is bore burnished then this must be allowed for in estimating the bearing life by the application factor a_C (Table 12, page 21).

Estimated Bearing Life

(4.4.13)   [h]

$$L_H = L_H \cdot a_C$$

For Oscillating Movements or Dynamic Loads

(4.4.14)   [cycles]

$$Z_T = L_H \cdot N_{osc} \cdot 60$$

for oscillating movements

(4.4.15)   [cycles]

$$Z_T = L_H \cdot C \cdot 60$$

for dynamic loads

Calculate estimated number of cycles Z_T

Check that Z_T is less than total number of cycles Q for the operating specific load p (Table 8, page 18)

If $Z_T < Q$, L_H will be limited by wear after Z_T cycles.

If $Z_T > Q$, L_H will be limited by fatigue after Z_T cycles.

Slideways

Specific Load Factor

(4.4.16)   [-]

$$a_{E1} = A - \frac{F}{p_{lim}}$$

If negative the bearing is overloaded and the bearing area should be increased.

Speed Temperature and Material Application Factors

(4.4.17)   [-]

$$a_{E2} = \frac{280 \cdot a_T \cdot a_M}{F \cdot U}$$

Relative Contact Area Factor

(4.4.18)   [-]

$$a_{E3} = \frac{A}{A_M}$$

Estimated Bearing Life

(4.4.19)   [h]

$$L_H = a_{E1} \cdot a_{E2} \cdot a_{E3} - a_L$$

Note:

Estimated bearing lives greater than 4000 h are subject to error due to inaccuracies in the extrapolation of test data.

4 Bearing Performance

5 Lubrication

DP4® provides excellent performance in lubricated applications. The following sections describe the basics of lubrication and provide guidance on the application of DP4® in such environments.

5.1 LUBRICANTS

DP4® can be used with most fluids including:

- water
- lubricating oils
- engine oil
- turbine oil
- hydraulic fluid
- solvent
- refrigerants

In general, the fluid will be acceptable if it does not chemically attack the PTFE/lead overlay or the porous bronze interlayer. Where there is doubt about the suitability of a fluid, a simple test is to submerge a sample of DP4® material in the fluid for two to or three weeks at 15-20 °C above the operating temperature.

The following will usually indicate that the fluid is not suitable for use with DP4®:

- A significant change in the thickness of the DP4® material,
- a visible change in the bearing surface other than some discolouration or staining,
- a visible change in the microstructure of the bronze interlayer.

5.2 TRIBOLOGY

There are three modes of lubricated bearing operation which relate to the thickness of the developed lubricant film between the bearing and the mating surface.

- Hydrodynamic lubrication
- Mixed film lubrication
- Boundary lubrication

These three modes of operation depend upon:

- Bearing dimensions
- Clearance
- Load
- Speed
- Lubricant Viscosity
- Lubricant Flow

Hydrodynamic lubrication

Characterised by:

- Complete separation of the shaft from the bearing by the lubricant film
- Very low friction and no wear of the bearing or shaft since there is no contact.
- Coefficients of friction of 0,001 to 0,01

Hydrodynamic conditions occur when:

(5.2.1)   [MPa]

$$p \leq \frac{U \cdot \eta}{7.5} \cdot \frac{B}{D_i}$$
Figure 24: Hydrodynamic lubrication

5 Lubrication

Mixed Film Lubrication

Characterised by:

— Combination of hydrodynamic and boundary lubrication.

— Part of the load is carried by localised areas of self pressurised lubricant and the remainder supported by boundary lubrication.

— Friction and wear depend upon the degree of hydrodynamic support developed.

— DP4® provides low friction and high wear resistance to support the boundary lubricated element of the load.
Figure 25: Mixed film lubrication

Boundary Lubrication

Characterised by:

— Rubbing of the shaft against the bearing with virtually no lubricant separating the two surfaces.

— Bearing material selection is critical to performance

— Shaft wear is likely due to contact between bearing and shaft.

— The excellent self lubricating properties of DP4® material minimises wear under these conditions.

— The dynamic coefficient of friction with DP4® is typically 0.05 to 0.3 under boundary lubrication conditions.

— The static coefficient of friction with DP4® is typically slightly above the dynamic coefficient of friction under boundary lubrication conditions.
Figure 26: Boundary lubrication

5.3 CHARACTERISTICS OF LUBRICATED DP4® BEARINGS

DP4® is particularly effective in the most demanding of lubricated applications where full hydrodynamic operation cannot be maintained, for example:

— High load conditions

In highly loaded applications operating under boundary or mixed film conditions DP4® shows excellent wear resistance and low friction.

— Start up and shut down under load

With insufficient speed to generate a hydrodynamic film the bearing will operate under boundary or mixed film conditions. DP4® minimises wear and requires less start up torque than conventional metallic bearings.

Note the following however:

If a DP4 bearing is required to run dry after running in water under non hydrodynamic conditions then the wear resistance will be substantially reduced due to an increased amount of bedding in wear.

Fig. 27, page 28 shows the three lubrication regimes discussed above plotted on a graph of sliding speed vs the ratio of specific load to lubricant viscosity.

— Using the formula in Section 4:
- Calculate the specific load p,
- calculate the shaft surface speed U.

— Sparse lubrication

Many applications require the bearing to operate with less than the ideal lubricant supply, typically with splash or mist lubrication only. DP4® requires significantly less lubricant than conventional metallic bearings.

— Non lubricating fluids

DP4® operates satisfactorily in low viscosity and non lubricating fluids such as water and some process fluids.

— Using the viscosity temperature relationships presented in Table 13:
- Determine the viscosity in centipoise of the lubricant.

Note:
Viscosity is a function of operating temperature. If the operating temperature of the fluid is unknown, a provisional temperature of 25 °C above ambient can be used.

5 Lubrication

5.4 DESIGN GUIDANCE
Fig. 27: Design guide for lubricated application

Explanation to figure 27

Area 1

The bearing will operate with boundary lubrication and pU factor will be the major determinant of bearing life. The DP4® bearing performance can be calculated using the method given in section 4, although the result will probably underestimate the bearing life

Area 2

The bearing will operate with mixed film lubrication and the pU factor is no longer a significant parameter in determining the bearing life. The DP4® bearing performance will depend upon the nature of the fluid and the actual service conditions.

Area 3

The bearing will operate with hydrodynamic lubrication. The bearing wear will be determined only by the cleanliness of the lubricant and the frequency of start up and shut down.

Area 4

These are the most demanding operating conditions. The bearing is operated under either high speed or high bearing load to viscosity ratio, or a combination of both. These conditions may cause:

— excessive operating temperature and/or

— high wear rate.

The bearing performance may be improved by adding one or more grooves to the bearing and a shaft surface finish <0.05 µm R_a.

5.5 CLEARANCES FOR LUBRICATED OPERATION

The recommended shaft and housing diameters given for standard DP4® bushes will provide sufficient clearance for applications operating with boundary lubrication.

For bearings operating with mixed film or hydrodynamic lubrication it may be necessary to improve the fluid flow through the bearing by reducing the recommended shaft diameter by approximately 0.1 %, particularly when the shaft surface speed exceeds 2.5 m/s.

5.6 GROOVING FOR LUBRICATED OPERATION

In demanding applications an axial oil groove will improve the performance of DP4®. Figure 28 shows the recommended form and location of a single groove with respect to the applied load and the bearing split. GGB can manufacture special DP4® bearings with embossed or milled grooves on request.

5.7 MATING SURFACE FINISH FOR LUBRICATED OPERATION

- $R_a \leq 0.4 \pm 0.1$ µm boundary lubrication

- $R_a = 0.1 - 0.2$ µm mixed film or hydrodynamic conditions

- $R_a \leq 0.05$ µm for the most demanding operating conditions

5.8 GREASE LUBRICATION

DP4® is not generally recommended for use with grease lubrication. In particular the following must be avoided:

- Dynamic loads - which can result in erosion of the PTFE/lead bearing surface.

- Greases with EP additives or fillers such as graphite or MoS_2 which can cause rapid wear of DP4®.

Under grease lubrication, improved performance can be obtained by the use of other GGB metal polymer bearing materials, for example, DX®, DX®10, DS, HI-EX®.

Please contact your local sales representative or onsult: https://www.ggbearings.com for more details.
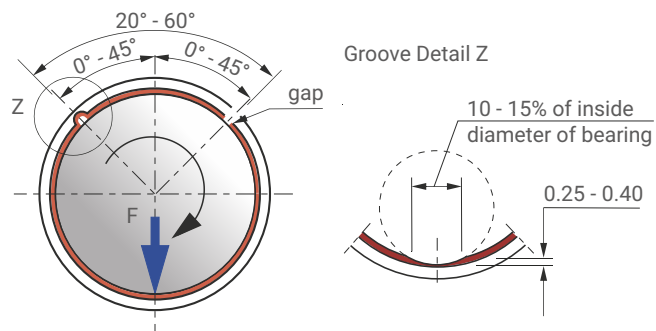

Fig. 28: Location of oil holes and grooves

6 Bearing Assembly

Dimensions and Tolerances

DP4® bushes are prefinished and excluding very exceptional circumstances, must not be broached, machined or otherwise modified in the bore. It is essential that the correct running clearance is used and that both the diameter of the shaft and the bore of the housing are finished to the limits given in the tables. Under dry running conditions any increase in the clearances given will result in a proportional reduction in performance.

If the bearing housing is unusually flexible the bush will not close in by the calculated amount and the running clearance will be more than the optimum. In these circumstances the housing should be bored slightly undersize or the journal diameter increased, the correct size being determined by experiment.

Where free running is essential, or where light loads (less than 0.1 MPa) prevail and the available torque is low, increased clearance is required and it is recommended that the shaft size quoted in the table be reduced by 0.025 mm.

6.1 ALLOWANCE FOR THERMAL EXPANSION

For operation in high temperature environments the clearance should be increased by the amounts indicated by figure 29 to compensate for the inward thermal expansion of the bearing lining.
Fig. 29: Increase in diametral clearance

If the housing is non-ferrous then the bore should be reduced by the amounts given in Table 14, in order to give an increased interference fit to the bush, with a similar reduction in the journal diameter additional to that indicated by figure 29.

HOUSING MATERIAL	REDUCTION IN HOUSING DIAMETER PER 100°C RISE	REDUCTION IN SHAFT DIAMETER PER100°C RISE
Aluminium alloys	0.1 %	0.1 % + values from Fig. 29
Copper base alloys	0.05 %	0.05 % + values from Fig. 29
Steel and cast iron	–	values from Fig. 29
Zinc base alloys	0.15 %	0.15 % + values from Fig. 29

Table 14: Allowance for high temperature

6.2 TOLERANCES FOR MINIMUM CLEARANCE

Where it is required to keep the variation of assembled clearance to a minimum, closer tolerances can be specified towards the upper end of the journal tolerance and the lower end of the housing tolerance. If housings to H6 tolerance are used, then the journals should be finished to the following limits. The sizes in Table 16 give the following nominal clearance range.

D_i	D_J
> 5 mm < 25 mm	-0.019 to -0.029
> 25 mm < 50 mm	-0.021 to -0.035

Table 15: Shaft tolerances for use with H6 housings

D_i	D_J
10 mm	0.009 to 0.080
50 mm	0.011 to 0.134

Table 16: Clearance vs bearing diameter

Burnishing

The burnishing or fine boring of the bore of an assembled DP4® bush in order to achieve a smaller clearance tolerance is only permissible if a substantial reduction in performance is acceptable. Fig. 24 shows a recommended burnishing tool for the sizing of DP4® bushes.

The coining section of the burnishing tool should be case hardened (case depth 0.6 - 1.2 mm, HRC 60±2) and polished with diamond paste ($R_Z \approx 1$ µm). A TiN type surface treatment increases the wear resistance of the burnishing tool and when absent gives a visual indication of burnishing tool wear.

Note: Ball burnishing of DP4® bushes is not recommended.

The values given in Table 17 indicate the dimensions of the burnishing tool required to give specific increases in the bearing bore diameter.

Exact values must be determined by test.

The reduction in bearing performance as a result of burnishing is allowed for in the bearing life calculation by the application factor a_C (Table 12, page 21). The impact of burnishing on the bearing and assembly should be validated by trials.
Fig. 30: Burnishing tool

$D_{i,a}$	$D_{i,a}$ + 0.050	$D_{i,a}$ + 0.1

Table 17: Burnishing tool tolerances

6.3 COUNTERFACE DESIGN

The suitability of mating surface materials and recommendations of mating surface finish for use with DP4® are discussed in detail on page 20.

DP4® is normally used in conjunction with ferrous journals and thrust faces, but in damp or corrosive surroundings, particularly without the protection of oil or grease, stainless steel, hard chromium plated mild steel, or hard anodised aluminium is recommended. When plated mating surfaces are specified the plating should possess adequate strength and adhesion, particularly if the bearing is to operate with high fluctuating loads.

The shaft or thrust collar used in conjunction with the DP4® bush or thrust washer must extend beyond the bearing surface in order to avoid cutting into it. The mating surface must also be free from grooves or flats, the end of the shaft should be given a lead-in chamfer and all sharp edges or projections which may damage the soft overlay of the DP4® must be removed.
Fig. 31: Counterface Design

Z
Fig. 33: Fitting of flanged bushes

Insertion Forces
Fig. 34: Maximum Insertion Force F_i

Alignment

Accurate alignment is an important consideration for all bearing assemblies, but is particularly so for dry bearings because there is no lubricant to spread the load. With DP4® bearings misalignment over the length of a bush (or pair of bushes), or over the diameter of a thrust washer should not exceed 0.020 mm as illustrated in Fig. 35.
Fig. 35: Alignment

Sealing

While DP4® can tolerate the ingress of some contaminant materials into the bearing without loss of performance, where there is the possibility of highly abrasive material entering the bearing, a suitable sealing arrangement, as illustrated in Fig. 36 should be provided.
Fig. 36: Recommended sealing arrangements

6.5 AXIAL LOCATION

Where axial location is necessary, it is advisable to fit DP4® thrust washers in conjunction with DP4® bushes, even when the axial loads are low.

Fitting of thrust washers

DP4® thrust washers should be located in a recess as shown in Fig. 37. For the recess diameter the tolerance class [D10] is recommended. The recess depth is given in the product tables, page 44 and following. If a recess is not possible one of the following methods may be used:

— Two dowel pins   — Two screws   — Adhesive   — Soldering (temperature < 320 °C).

6 Bearing Assembly

Important Note

- Ensure the washer ID does not touch the shaft after assembly

- Ensure that the washer is mounted with the steel backing to the housing

- Dowels pins should be recessed 0.25 mm below the bearing surface

- Screws should be countersunk 0.25 mm below the bearing surface

- DP4® must not be heated above 320 °C

- Contact adhesive manufacturers for guidance selection of suitable adhesives

- Protect the bearing surface to prevent contact with adhesive
Fig. 37: Installation of Thrust-Washer

Grooves for Wear Debris Removal

Tests with thrust washers have demonstrated that for optimum dry wear performance at specific loads in excess of 35 MPa, four wear debris removal grooves should be machined in the bearing surface as shown in Fig. 38.

Grooves in bushes have not been found to be beneficial in this respect.

$0.1 \times D_i$ 0.4 deep
Fig. 38: Debris removal grooves

Slideways

DP4® strip material for use as slideway bearings should be installed using one of the following methods:

- Countersunk screws
- Adhesives
- Mechanical location as shown in Fig. 39
Fig. 39: Mechanical location of DU slideplates

7 Modification

7.1 CUTTING AND MACHINING

The modification of DP4® bearing components requires no special procedures. In general it is more satisfactory to perform machining or drilling operations from the PTFE side in order to avoid burrs. When cutting is done from the steel side, the minimum cutting pressure should be used and care taken to ensure that any steel or bronze particles protruding into the remaining bearing material, and all burrs, are removed.

Drilling Oil Holes

Bushes should be adequately supported during the drilling operation to ensure that no distortion is caused by the drilling pressure.

Cutting Strip Material

DP4® strip material may be cut to size by any one of the following methods.

Care must be taken to protect the bearing surface from damage and to ensure that no deformation of the strip occurs:

- Using side and face cutter, or slitting saw, with the strip held flat and securely on a horizontal milling machine.

- Cropping

- Guillotine (For widths less than 90 mm only)

- Water-jet cutting

- Laser cutting (see Health Warning)

7.2 ELECTROPLATING

DP4® Components

In order to provide some protection in mildly corrosive environments the steel back and end faces of standard range DP4® bearings are tin flashed.

DP4® can be electroplated with most of the conventional electroplating metals including the following:

- zinc ISO 2081

- nickel ISO 1456

- hard chromium ISO 1456

For the harder materials if the specified plating thickness exceeds approximately 5 µm then the housing diameter should be increased by twice the plating thickness in order to maintain the correct assembled bearing bore size.

Where electrolytic attack is possible tests should be conducted to ensure that all the materials in the bearing environment are mutually compatible.

9 TEST METHODS

9.1 MEASUREMENT OF WRAPPED BUSHES

It is not possible to accurately measure the external and internal diameters of a wrapped bush in the free condition. In its free state a wrapped bush will not be perfectly cylindrical and the butt joint may be open. When correctly installed in a housing the butt joint will be tightly closed and the bush will conform to the housing. For this reason the external diameter and internal diameter of a wrapped bush can only be checked with special gauges and test equipment.

The checking methods are defined in ISO 3547 Parts 1 to 7.

Test A of ISO 3547 Part 2

Checking the external diameter in a test machine with checking blocks and adjusting mandrel.

| TEST A OF ISO 3547 PART 2 ON 2015DP4®	
Checking block and setting mandrel $d_{ch,1}$	23.062 mm
Test force F_{ch}	4500 N
Limits for Δz	0 and -0.065 mm
Bush Outside diameter D_O	23.035 to 23.075 mm

Table 18 : Test A of ISO 3547 Part 2

Fig.40 : Test A, data for drawing

Test B (alternatively to Test A)

Check external diameter with GO and NO GO ring gauges.

Test C

Checking the internal diameter of a bush pressed into a ring gauge, which nominal diameter corresponds to the dimension specified in table 6 of ISO 3547 Part 2 (Example D_i = 20 mm).

Fig.41 : Test C, data for drawing

Measurement of Wall Thickness (alternatively to Test C)

The wall thickness is measured at one, two or three positions axially according to the bearing dimensions.

| B [mm]	X [mm]	MEASUREMENT POSITION
≤15	B/2	1
>15 ≤50	4	2
>50 ≤90	6 and B/2	3
>90	8 and B/2	3

Table 19 : Measurement position

Fig.42 : Test C, measurement position

Test D

Check external diameter by precision measuring tape.

DATA FOR BEARING DESIGN CALCULATION

Application: _____

_____

Project/No.: _____ Quantity: _____ ☐ New Design ☐ Existing Design

☐ Steady load   ☐ Rotating load   ☐ Rotational movement   ☐ Oscillating movement   ☐ Linear movement

DIMENSIONS [MM]

Inside diameter	D_i	
Outside diameter	D_o	
Length	B	
Flange Diameter	D_{fl}	
Flange thickness	B_{fl}	
Wall thickness	S_T	
Length of slideplate	L	
Width of slideplate	W	
Thickness of slideplate	S_S	

LOAD

☐ Static load
☐ Dynamic load

Axial load F	[N]	
Radial load F	[N]	

MOVEMENT

Rotational speed	N [1/min]	
Speed	U [m/s]	
Length of stroke	L_S [mm]	
Frequency of stroke	[1/min]	
Oscillating cycle	φ [°]	

Osc. frequence	N_{osz} [1/min]	
MATING SURFACE

Material		
Hardness	HB/HRC	
Surface finish	Ra [μm]	

FITS & TOLERANCES

Shaft	D_J	
Bearing housing	D_H	

OPERATING ENVIRONMENT

Ambient temperature	T_{amb}[°]	
Bearing housing material		

☐ Housing with good heating transfer properties
☐ Light pressing or insulated housing with poor heat transfer properties
☐ Non metal housing with poor heat transfer properties
☐ Alternate operation in water and dry

LUBRICATION

☐ Dry
☐ Continuous lubrication
☐ Process fluid lubrication
☐ Initial lubrication only
☐ Hydrodynamic conditions

Process fluid		
Lubricant		
Dynamic viscosity	η[mPas]	

SERVICE HOURS PER DAY

Continuous operation	
Intermittent operation	
Operating time	
Days per year	

SERVICE LIFE

Required service life	L_H [h]	

BEARING TYPE

☐ Cylindrical bush

☐ Flanged bush

☐ Thrust washer

☐ Slideplate

☐ Special parts (sketch)

FORMULA SYMBOLS AND DESIGNATIONS

SYMBOL	UNIT	DESIGNATION
A	mm²	Surface area of DU® bearing
A_M	mm²	Surface area of mating surface in contact with DU® bearing (slideway)
a_B	-	Bearing size factor
a_C	-	Application factor for bore burnishing or machining
a_E	-	High load factor
a_{E1}	-	Specific load factor (slideways)
a_{E2}	-	Speed, temperature and material factor (slideways)
a_{E3}	-	Relative contact area factor (slideways)
a_L	-	Life correction constant
a_M	-	Mating surface material factor
a_T	-	Temperature application factor
B	mm	Nominal bush length
C	1/min	Dynamic load frequency
C_D	mm	Installed diametrical clearance
C_i	mm	ID chamfer length
C_o	mm	OD chamfer length
C_T	-	Total number of dynamic load cycles
D_C	mm	Diameter of burnishing tool
D_{fl}	mm	Nominal bush flange OD
D_H	mm	Housing Diameter
D_i	mm	Nominal bush and thrust washer ID
$D_{i,a}$	mm	Bush ID when assembled in housing
D_J	mm	Shaft diameter
D_{Nth}	nvt	Max. thermal neutron dose
D_o	mm	Nominal bush and thrust washer OD
D_Y	Gy	Max. Gamma radiation dose
d_D	mm	Dowel hole diameter
d_L	mm	Oil hole diameter
d_p	mm	Pitch circle diameter for dowel hole
F	N	Bearing load
F_{ch}	N	Test force
F_i	N	Insertion force
f	-	Coefficient of friction

SYMBOL	UNIT	DESIGNATION
H_a	mm	Depth of housing recess (e.g. for thrust washers)
H_d	mm	Diameter of housing recess (e.g. for thrust washers)
L	mm	Strip length
L_H	h	Bearing service life
L_S	mm	Length of stroke (slideway)
N	1/min	Rotational speed
N_{osz}	1/min	Oscillating movement frequency
p	MPa	Specific load
p_{lim}	MPa	Specific load limit
$p_{sta,max}$	MPa	Maximum static load
$p_{dyn,max}$	MPa	Maximum dynamic load
Q	-	Permissible number of cycles
R_a	µm	Surface roughness (DIN 4768, ISO/DIN 4287/1)
R_{OB}	Ω	Electrical resistance
s_3	mm	Bush wall thickness
s_{fl}	mm	Flange thickness
s_S	mm	Strip thickness
s_T	mm	Thrust washer thickness
T	°C	Temperature
T_{amb}	°C	Ambient temperature
T_{max}	°C	Maximum temperature
T_{min}	°C	Minimum temperature
U	m/s	Sliding speed
W	mm	Strip width
$W_{U\,min}$	mm	Minimum usable strip width
Z_T	-	Total number of cycles
α_1	$1/10^6$K	Coefficient of linear thermal expansion parallel to surface
α_2	$1/10^6$K	Coefficient of linear thermal expansion normal to surface
σ_c	MPa	Compressive yield strength
λ	W/mK	Thermal conductivity
φ	°	Angular displacement
η	cP	Dynamic viscosity

Product Information

GGB assures the products described in this document have no manufacturing errors or material deficiencies.

The details set out in this document are registered to assist in assessing material suitability for intended use. They have been developed from our own investigations as well as generally accessible publications. They do not represent any assurance for the properties themselves.

Unless expressly declared in writing, GGB gives no warranty that the products described are suited for any particular purpose or specific operating circumstances. GGB accepts no liability for any losses, damages, or costs however they may arise through direct or indirect use of these products.

GGB's sales and delivery terms and conditions, included as an integral part of quotations, stock and price lists, apply absolutely to all business conducted by GGB. Copies can be made available on request.

Products are subject to continual development. GGB retains the right to make specification amendments or improvements to technical data without prior announcement. Edition 2023 (this edition replaces earlier editions which hereby lose their validity).

STATEMENT REGARDING LEAD CONTENT IN GGB PRODUCTS & EU DIRECTIVE COMPLIANCE

GGB is committed to adhering to all U.S., European, and international standards and regulations with regard to lead content. We have established internal processes that monitor any changes to existing standards and regulations, and we work collaboratively with customers and distributors to ensure all requirements are strictly followed. This includes RoHS and REACH guidelines.

GGB makes it a top priority to operate in an environmentally conscious and safe manner. We follow numerous industry best practices and are committed to meeting or exceeding a variety of internationally recognized standards for emissions control and workplace safety.

Each of our global locations has management systems in place that adhere to IATF 16949, ISO 9001, ISO 14001, OHSAS 18001, and AS9100D/EN9100 quality regulations.

All of our certificates can be found here: **https://www.ggbearings.com/en/certificates**. A detailed explanation of our commitment to REACH and RoHS directives can be found at **https://www.ggbearings.com/en/who-we-are/quality-and-environment**
